NodeNexus: Serverless Node.js CI/CD Deployment Pipeline

NodeNexus is a serverless CI/CD pipeline designed to automate the build and deployment of a Node.js application using AWS cloud services.

In this project, whenever a developer pushes code to a GitHub repository, the pipeline is automatically triggered. AWS CodePipeline orchestrates the entire workflow by fetching the latest code and passing it to AWS CodeBuild, where dependencies are installed and the application is prepared. After a successful build, the updated application is deployed to AWS Lambda, where it runs as a serverless Node.js function.

This approach eliminates manual deployment, reduces errors, and ensures continuous integration and continuous delivery (CI/CD). The system is fully automated, scalable, and does not require any local Node.js setup or server management, making it efficient and cost-effective.

SERVICES USED (with purpose)

- GitHub → Stores Node.js source code & triggers pipeline
- AWS CodePipeline → Automates CI/CD workflow
- AWS CodeBuild → Installs dependencies & builds application
- AWS Lambda → Executes Node.js application

SERVICES USED (with purpose)

- GitHub → Stores Node.js source code & triggers pipeline
- AWS CodePipeline → Automates CI/CD workflow
- AWS CodeBuild → Installs dependencies & builds application
- AWS Lambda → Executes Node.js application

ARCHITECTURE FLOW

GitHub → CodePipeline → CodeBuild → Lambda
